Building your Army

With ASolaF-Stats.com/builder

Go to ASolaF-Stats.com/builder and build you army. Save it. Then scroll down to the army lists and click on the army name in the list on the right side of the screen.

The screenshot shows the 'builder' interface with several sections: 'Combat Units' with an 'Add Combat Unit' button, 'Add Attachment' button, and 'NCUs' with an 'Add NCU' button. Below these is the 'Enemy Attachments' section. On the right, there are status messages: 'You do not have a commander', 'You have no combat units', and 'You have unspent points'. A 'List Name' input field with the placeholder 'Please Name List' and a 'Save List' button are also present. At the bottom right, the 'Your Saved Lists' section displays three lists: 'Starks - Howland' (Stark - Howland Reed (40)), 'Starks - Howland' (Stark - Howland Reed (40)), and 'Starks - Robb's Cavalry' (Stark - Robb Stark (40)). The first list is highlighted with a red circle. A 'Points 0 / 40' indicator is shown in the center.

78b020-db58-11ea-b4a0-f9db15af6956

This will take you to the army list where you need to press the TTS Export button, which will copy the list's unique identifier to your clipboard.

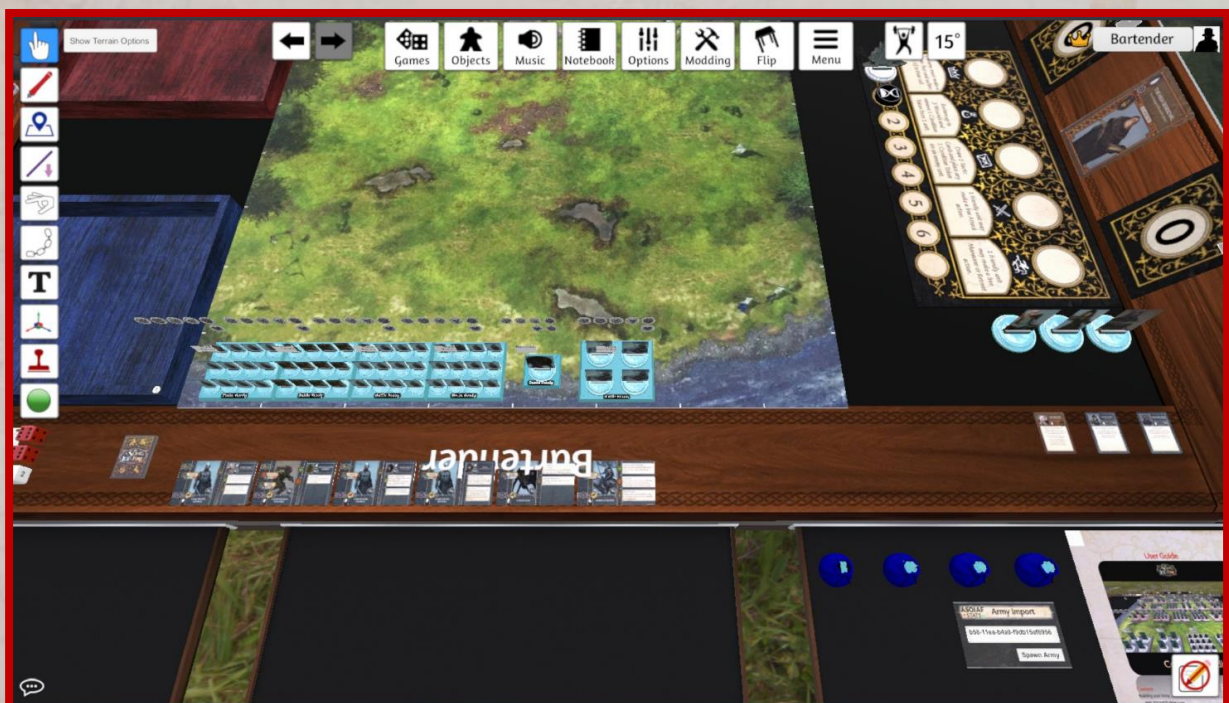

The screenshot shows the 'Army List' interface. At the top, there is a 'Commander' section with a 'See Tactics Deck' button and a '40' point indicator. Below this, the 'Combat Units' section lists: 'House UMBER Greataxes Infantry' (7 Pts), 'Howland Reed Lord of the Crannogs' (0 Pts), 'Crannogman Trackers Infantry' (5 Pts), 'Syrio Forel First Blade of Braavos' (2 Pts), and 'Stark Bowmen Infantry'. The 'NCUs' section lists: 'Arya Stark The Wolf Girl' (4 Pts), 'Sansa Stark Little Bird' (4 Pts), and 'Rodrik Cassel Combat Veteran' (4 Pts). At the bottom, there are two buttons: 'Export' (highlighted with a red circle) and 'Share This List'.

Afterwards open the ASolaF Community Edition Mod in tabletop simulator and find the list importer on the tray next to this help manual. Enter the text box and press [CTRL+V] to paste the id into the text box. Then click [Spawn Army].

This will spawn the army neatly positioned on your side of the table. Careful though: spawning the army in a place where you have already spawned a previous army will mess up things 😊.

If everything went well, the army should show up as seen below.

The tactics deck to the left. The Unit cards and their attachments to the right of the tactics deck. The unit trays above the cards on the battle mat. To the right of the battle mat enemy attachments and other specials. NCUs and their respective cards will load below the tactics board.

Non-Combat Units

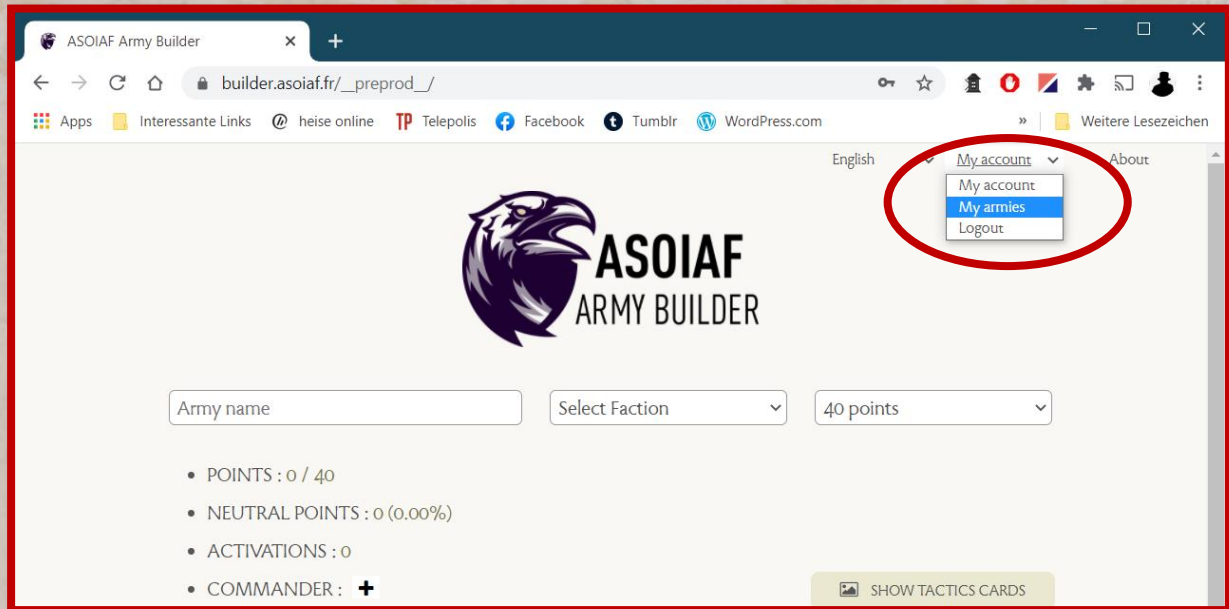

- Arya Stark - The Wolf Girl (3)
- Sansa Stark – Little Bird (3)
- Lord Varys – The Spider (4)

Edit ArmyCopy To ClipboardCopy TTS Code to ClipboardDelete Army

Another good way to build an army for the ASoIaF TTS community edition is to go to <https://www.asoiafbuilder.com/>, build your army there, save it and then export it to Tabletop Simulator, by clicking the Copy TTS Code to Clipboard button below your army list.

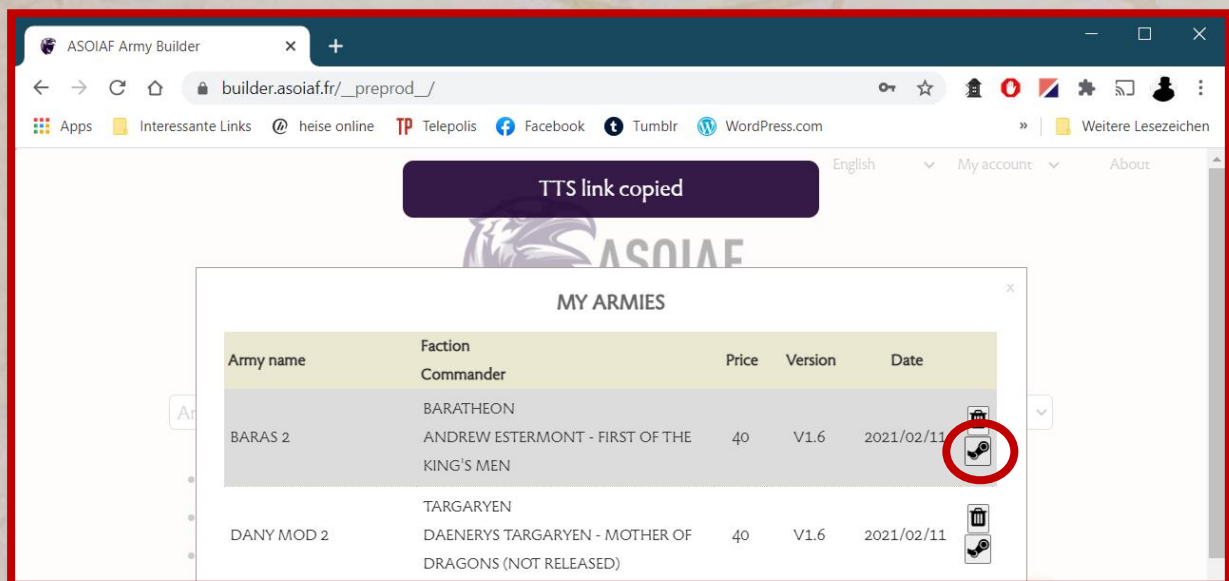

Then go to TTS and follow the instructions under “Import With ASoIaF-Stats.com/builder”. Only select the ASOIAFBuilder.com from the import gadgets drop down before clicking spawn.

With builder.asoiaf.fr

Sing into your builder.asoiaf.fr account. In the upper right corner click on My account->My armies. This will bring up a list of all your saved armies.

Click on the small Steam icon next to the army you want to export. A notification will confirm that the army ID was copied to your clipboard.

Then go to TTS and follow the instructions under "Import With ASolaF-Stats. com/builder". Only select the ASolaF.fr from the import gadgets drop down before clicking spawn.

On the Board to the left you'll find an area where you can display any army by clicking it's logo on the display widget. Spawning a different army will automatically clear the area. You can also clear the area by clicking the associated button if you wish.

The combat units, attachments, NCUs, commander and their cards, can be copied with CTRL+C while hovering the mouse cursor over them and then pasted with CTRL+P if you need multiple copies. If only one copy is needed, you can just drag the unit and its cards to your deployment area.

Use the [Detach](#) button below each model to remove the model, if you wish to add an attachment.

Then copy and paste or drag and drop the attachment into the now empty spot on the tray.

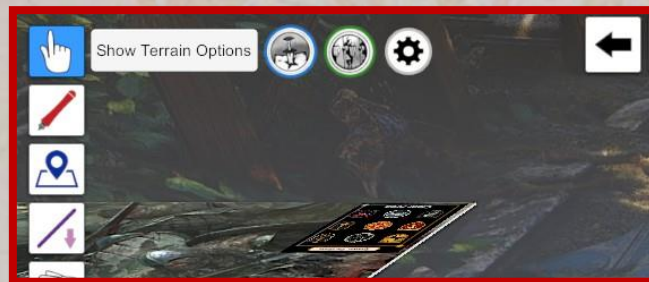

Game Options

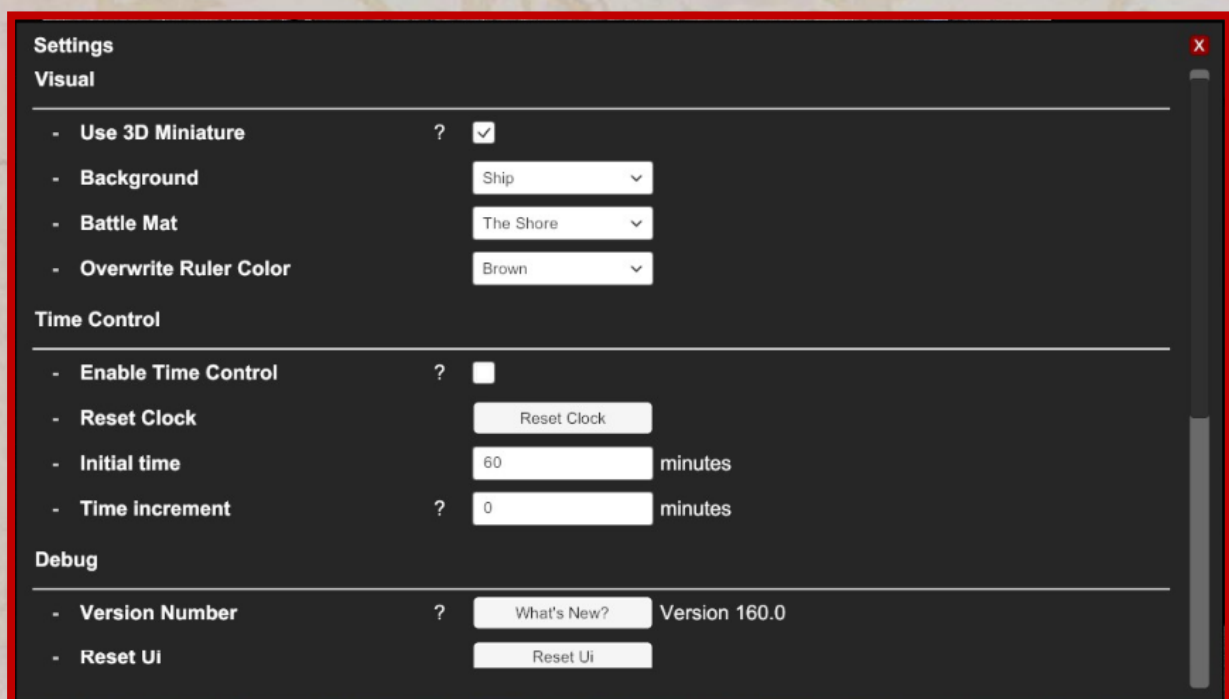

The game options panel lets you adjust the mod's visuals such as background, battle mat and toggling between 3D models and standees.

It also provides access to a built-in chess clock.

To open it, press the cog wheel on the controls panel in the upper left corner.

This will bring up the following panel:

Visual

Use 3D Miniatures

By default, the mod will use 3D models when importing armies. For computers with limited power, this may degrade performance. This check box allows the user to switch between standees and 3D models.

Uncheck to use standees instead of 3D models. Check to use models again. This should be set up before importing or spawning an army as it will lead to unpredictable behavior when switched during a game.

Background

This allows you to select from a range of backgrounds that surround the table. If you prefer playing on a mountain top or a pirate ship, this is where you get to choose your backdrop.

Battle Mat

Here you can choose from a few different mats to play on. You just have to agree with your playing partner whether you want to spill blood on a fresh green meadow or in the pristine snow beyond the wall.

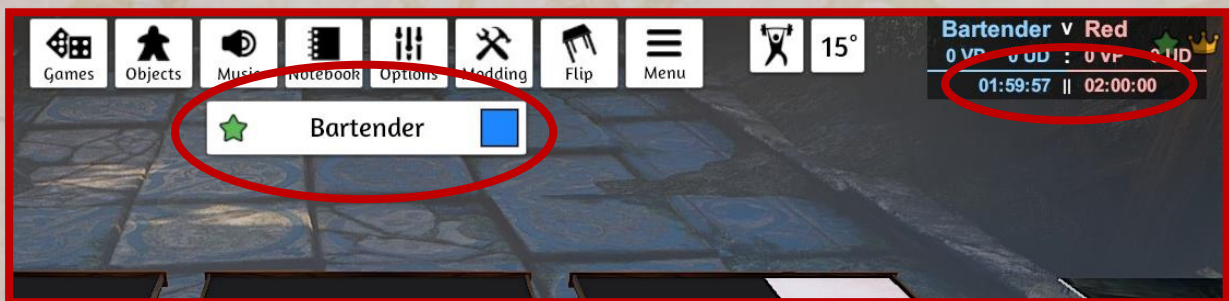

Overwrite Ruler Color

Each battle mat has its default ruler color. If you prefer a different color, you can adjust it here. This will not instantly update the color of active rulers. To see its effect you need to end current actions (such as pivot) and activate it again. This will affect all players. So please make sure your opponent agrees with your choice. If you cannot agree going with the battle mat's default is probably a good idea.

Time Control

Enable Time Control

Disabled by default. When you check this box a chess clock is initiated with an initial time as agreed on by the players. The timer uses the Tabletop Simulator's built-in turn system. When you are done with your turn, press the button with your name on top of the screen. This will stop your clock and start your opponent's clock. Be kind and remind one another to push that button between turns.

Reset Clock

Resets both clocks to the initial time.

Initial Time

The minutes initially granted to each player.

Time Increment

Allows you to play with flexible clocks and will add this many minutes to a player's clock when their turn starts. Use carefully as unintended turn overs will grant additional time to the players when it should not.

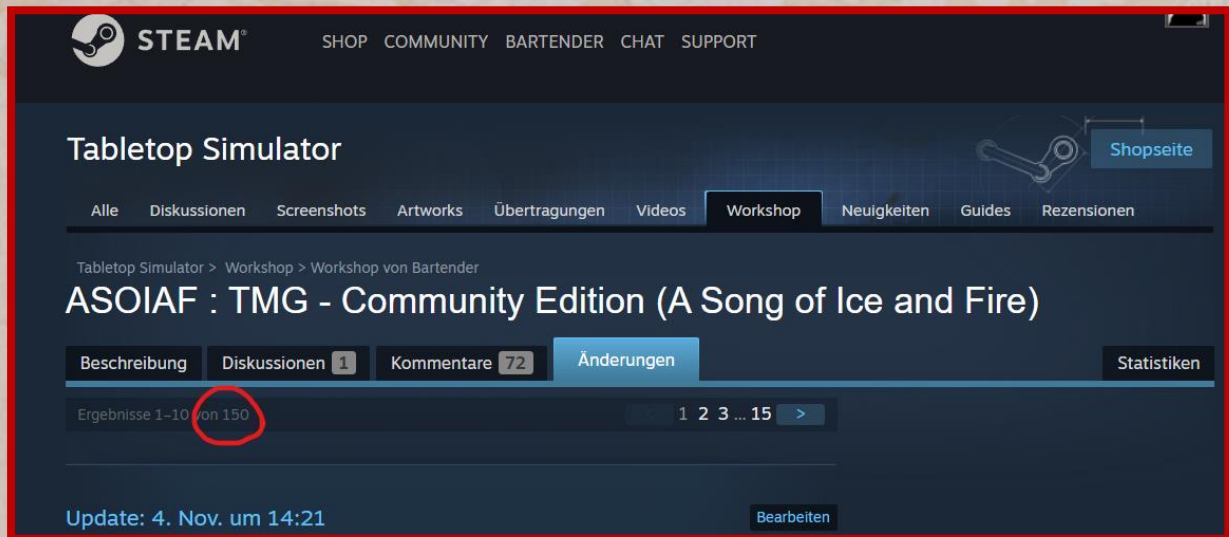

Debug

Version Number

The current mod release. Unless you are a play tester this is identical the mod's change notes number which can be found here:

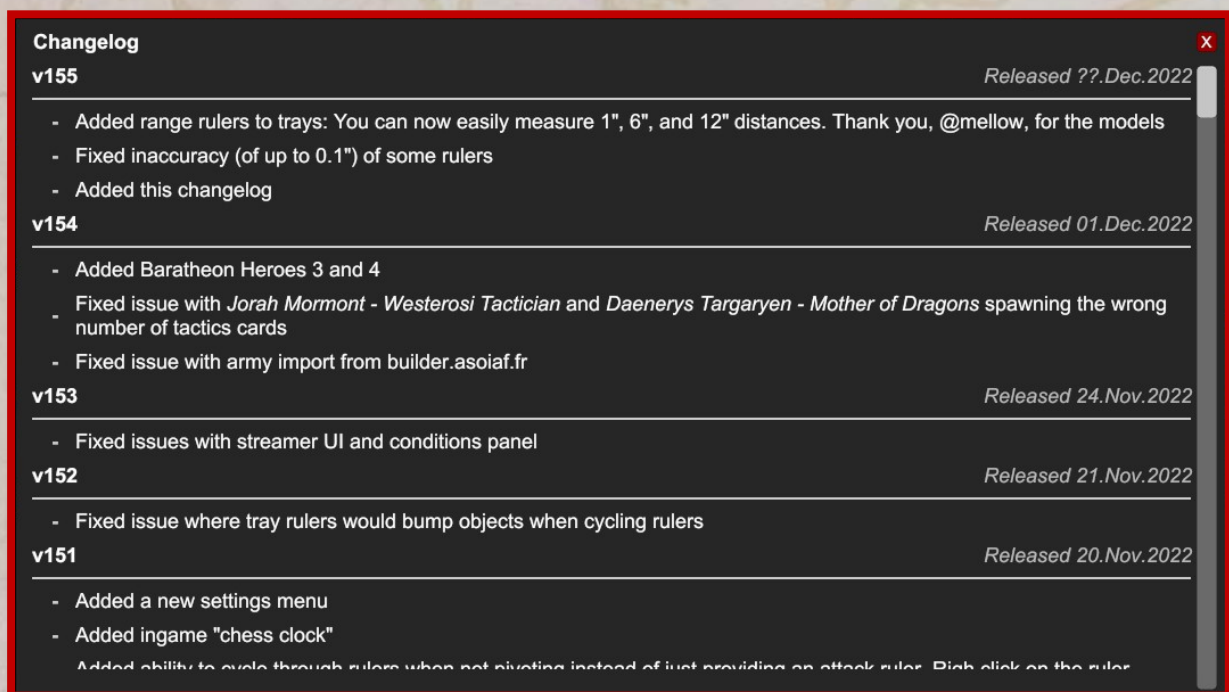

<https://steamcommunity.com/sharedfiles/filedetails/changelog/2077621477>

Please use this when reporting issues on our Discord server: <https://discord.gg/hCrNpeAS5z>

What's New

The "What's New" button will bring up the mod's change log, listing recent changes.

Reset UI

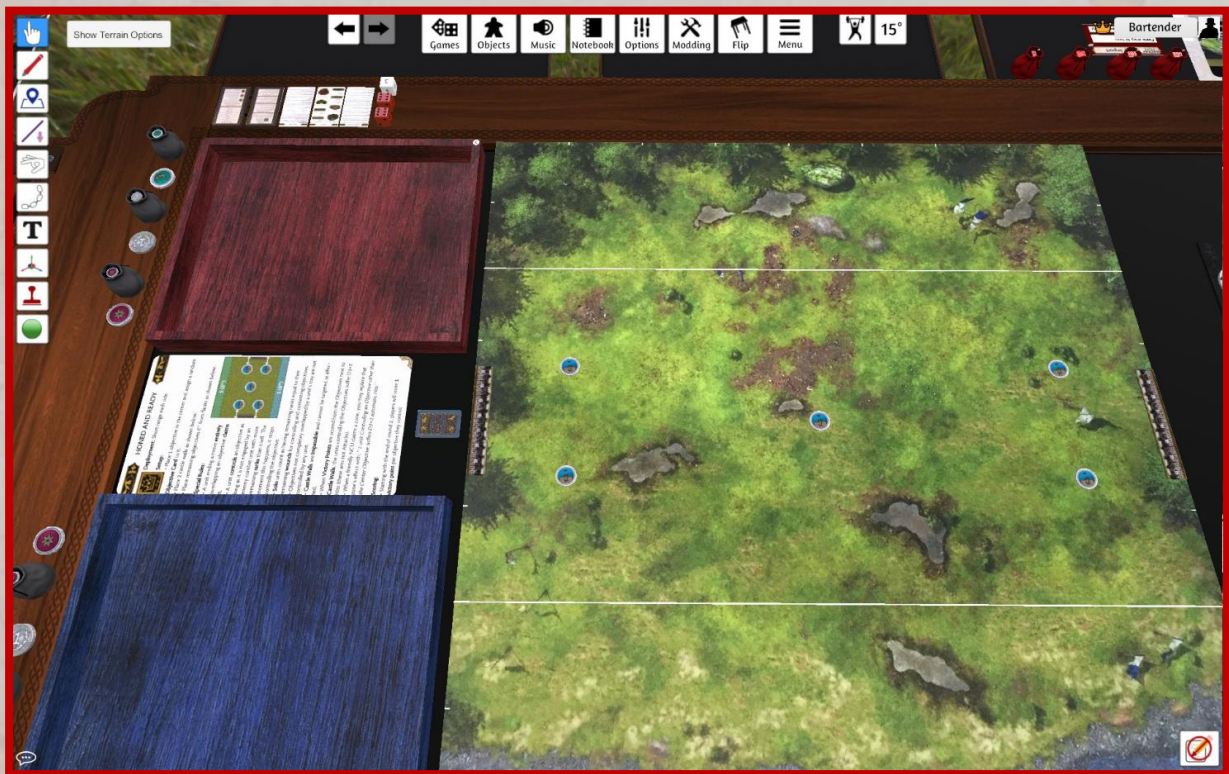

Sometimes, when rejoining a game after a disconnect, some User Interface elements such as condition tokens may no longer be rendered. If this happens the Reset UI button can be used to re-initiate rendering of the UI.

Chose game mode

You can choose a game mode by either selecting or randomly drawing one from the stacks of game mode cards next to the terrain box.

Drop it onto the game mode deployment spot between the dice trays in order to automatically spawn deployment zones and game mode assets such as objectives, cards and terrain.

Terrain

Terrain is found in the Terrain & objectives box to the host's left side of the table. Click Place to unpack the box. Then drag terrain as needed from the bags on to the battlefield.

Toggle between 2D and 3D Terrain

Terrain consists of 3D objects placed on the game's standard 2D terrain and it is easy to toggle between the 2 states. Right click the terrain, expand State and then click on [2] to switch to the 2D state or [1] to switch back to the 3D state. Alternatively point on the terrain and press the number on your keyboard corresponding to the state ([1] for 3D and [2] for 2D). Use the numbers above your main keyboard. The number block will not work for this purpose as it is mapped to other functions. So, why would you want to switch between 2D and 3D: well, for one 2D provides better overview, but the main reason is, that your units may get stuck in terrain or jump when you end a movement inside a terrain. So before moving onto a terrain, it is best to switch to the 2D mode.

Fill tray & Heal a unit

During deployment pressing the (+) buttons on the tray will fill the tray up to the selected spot with the model positioned furthest from the top left position. In the example above, the Sworn Swords will be used.

Once the unit is made battle ready, it remembers which type of unit it is supposed to be and even when it is down to its attachment it will use the correct type of model to heal up.

Battle Ready

Clicking the (Battle Ready) button at the bottom of the tray will switch the unit to its battle-ready mode. It will be locked and can only be interacted with via its controls: (Attack), (Pivot), (Move), (Charge)

Pivot

In order to pivot, click the Unit's Pivot button. This will bring up the pivot user interface. Use the slider at the top of the screen to pivot left & right. Click Fine Pivot to have more control and pivot a smaller amount.

Pivot Done will commit the new orientation. Pivot Undo will reset the unit to its original orientation. The 4 ruler buttons will display different rulers which help to optimally align the unit.

Toggle Highlight will highlight the current ruler. This allows the ruler to remain visible, even when obstructed by other units, allowing perfect flank alignment in those circumstances.

Move

Press the move button to move a unit. It will bring up a ruler, which is separated into one-inch segments, allowing precise movement. This will also put the unit on “rails” allowing only movement to its sides, front and back.

Ruler

The ruler button allows you to cycle through the available rulers to quickly determine attack-, effect- and move-ranges as well as possible tray alignments. Repeatedly clicking the Ruler button with the left mouse button will display a different ruler and also end the function after the cycle is complete.

Right-clicking the button will immediately close the function.

While active, Highlight will highlight the current ruler. This allows the ruler to remain visible, even when obstructed by other units, allowing perfect flank alignment in those circumstances.

The rulers are:

Attack

Shows a unit's LOS angles. It also shows concentric short- and long-range circles centered on the unit's front, which will be useful to see whether a target can be attacked by a ranged unit. Use this on the target of a charge to see whether you will do a flank, front or back charge.

Range

Also shows a unit's LOS angles as well as concentric rings. These however are centered on the unit's tray and show 1", 6" and 12" zones of effect to quickly indicate minimum distance between units, short- and long-range effects that are not ranged attacks.

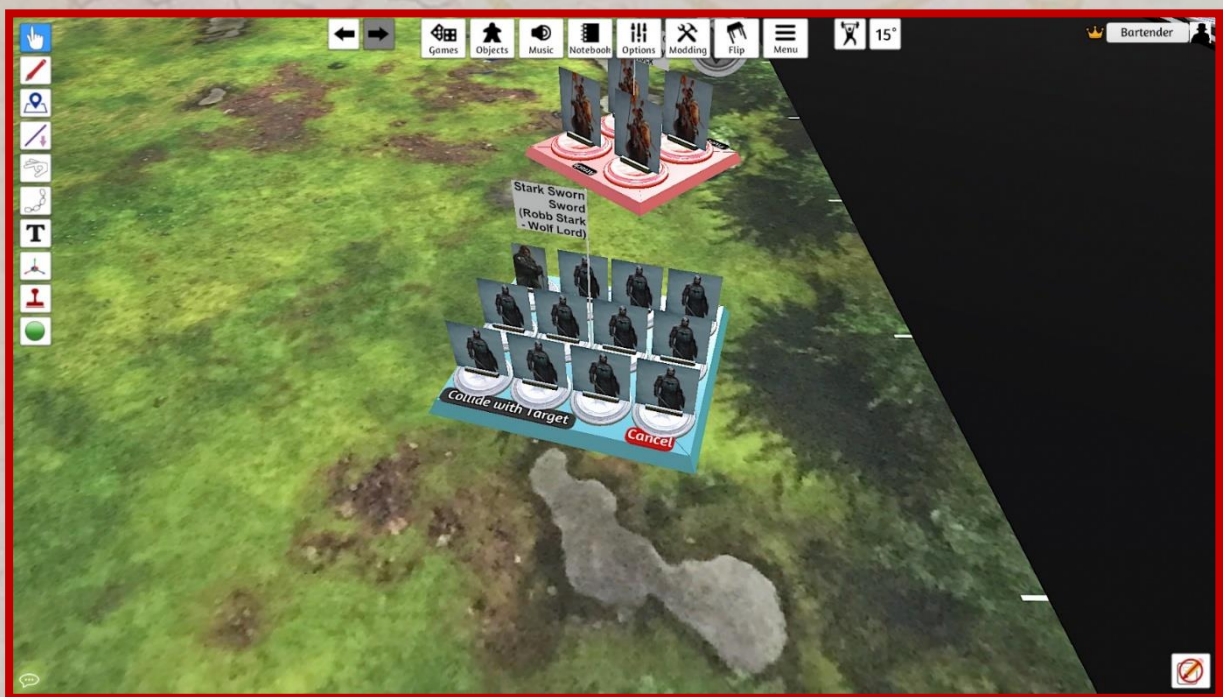

Move

Shows the unit's current move options without pivoting. The short lines are 1 inch and the long lines are 5 inches apart.

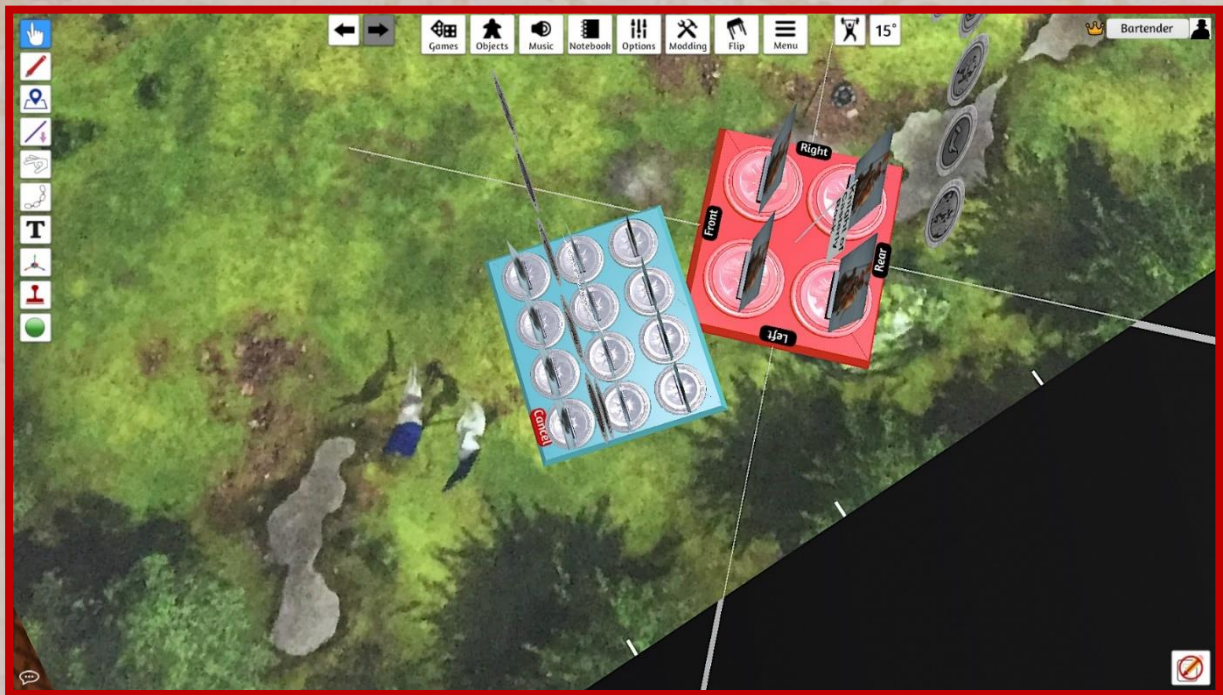

Align

This shows how a charging unit would have to align and can be used to gauge whether a charge is even possible. Very useful when trying to charge block.

Charge

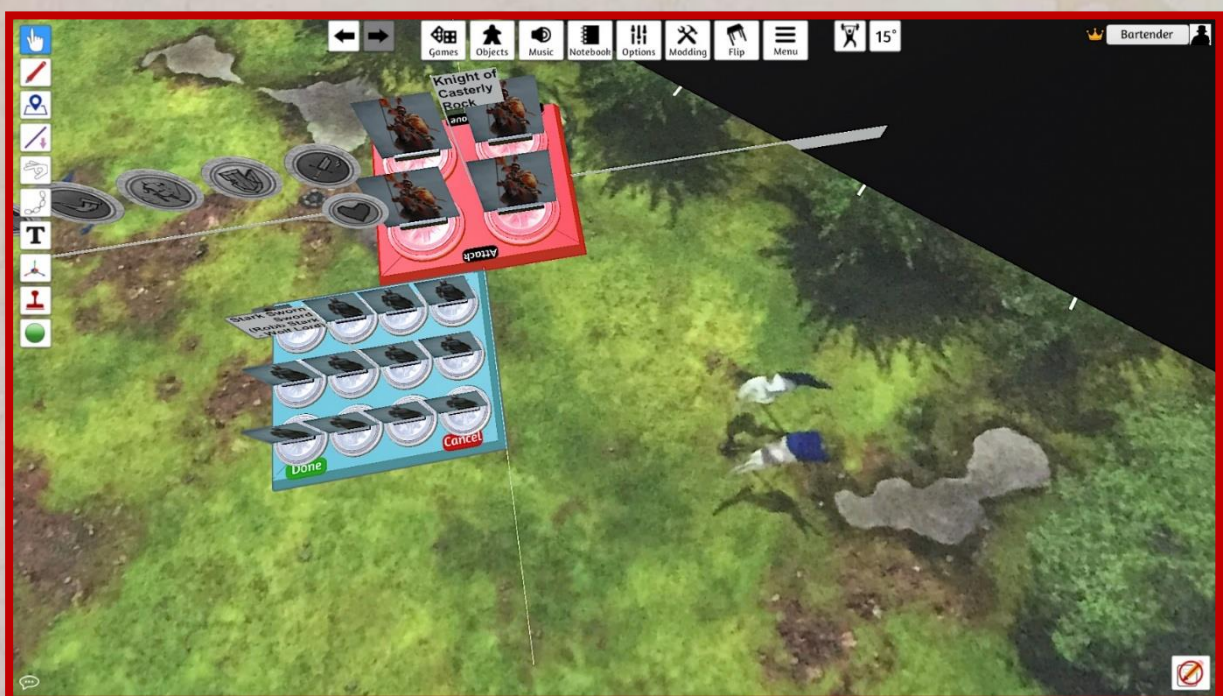

Pressing the charge button will allow you to move a unit freely. Drag it into contact with the target of the charge. This will display align buttons on the charged unit.

Click the button on the side that you charged. It will rotate the charging unit and position it flush with its target.

Drag the unit left or right to align 100% or 50% to either side.

Click Done in order to commit the Charge. Cancel will return the unit to its position prior to the charge.

Store & Recall Tray Location

When you need to try out complex maneuvers before executing them it is beneficial to store the tray's current location so you can later return the tray to its original position in case the maneuver does not work as planned. To do so, right click the tray and chose "Store Location" before you move.

When you need to return the Tray, right click, and chose “Recall Location”. **NOTE:** this will return the tray to the last stored location. So, if you moved on and did not use the store location option, your tray may end up in a location from a couple of turns ago. So please, use this function with discretion.

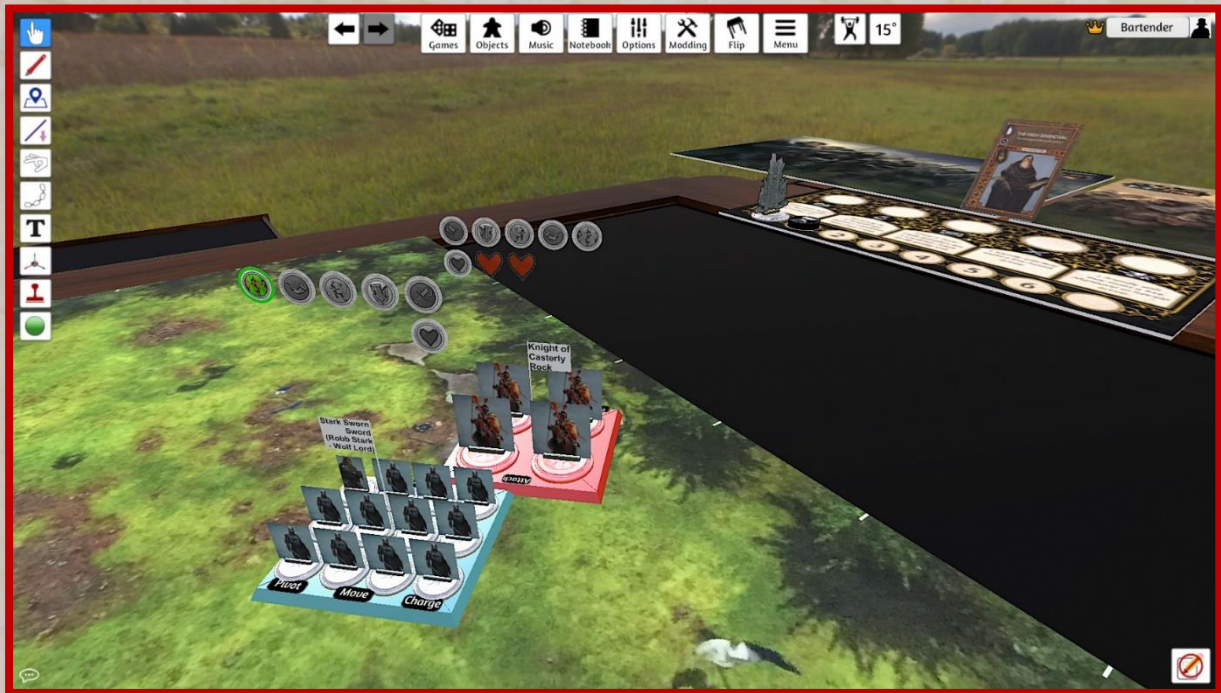

Condition & State Panel

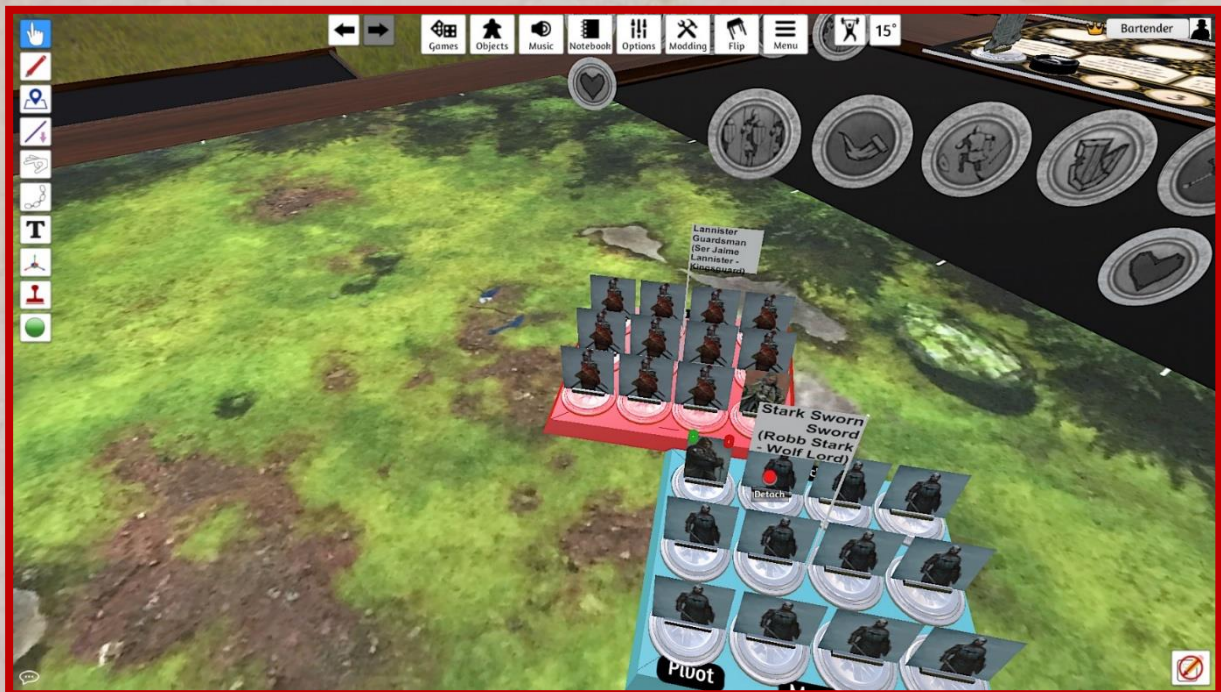

Track a unit's conditions and whether it has been activated or used its main order via the buttons floating above it. Clicking a button once will activate it. Clicking it again will deactivate it.

Wound

Clicking the button with the heart in its center will add a wound to a unit. Models with multiple wounds will display a heart for each wound taken. Click a heart to heal the wound. Once a model's wound cap is reached the model is removed.

Detach

Occasionally you may need to remove a specific model like an attachment killed by Kingsguard Jamie Lannister or if you need to move a model from one tray to another, like when Osha uses her Run Child ability to move Rickon Stark to a different unit. If this comes up, click that model's base (it'll display a tooltip "Detach" when you hover over it). This will detach the model from the tray. If this was a mistake, click the green button that shows up on the model, to return it to its tray. Click the red button to remove it from game. You can also pick up the model and drop it on a different tray.

Detach while deploying trays

Detaching a model during deployment (before having pressed “Battle Ready”), will simply remove the model from the tray, without further question. This is to speed up the process if you need to add an attachment to a unit.

The Dice Trays

The dice trays will sort, group and count dice that are placed on it. This will make re-rolling a subset of dice rather convenient. Just drag a box around the dice you need to re-roll and press R to cast them.

Once at rest the tray will group the dice based on their value and display the total number of dice rolled for each value as well as the total number of dice rolled.

Dice Tray Control Panel

The tray's control panel is used to spawn dice, set a target number and roll / re-roll any dice. Also, while the panel is opened the dice counter in the tray's corner displays successes out of total dice cast, instead of just the total number of dice.

Use the slider in the middle to quickly adjust the number of dice. The [<] and [>] buttons to the slider's left and right can also be used to the dice count.

[Roll] Casts any dice currently on the tray, including Panic Dice and D3.

[Failures] Re-rolls any dice with a value lower than the target number displayed on the tray's side.

[Successes] Re-rolls any dice with a value equal to, or higher than the target number displayed on the tray's side.

The Slider below the target number can be used to adjust the current target number.

The 2 small panic icons above the Target number allow you to spawn and immediately roll the panic dice.

The drop down can be used to change the look of the dice to any of the factions.

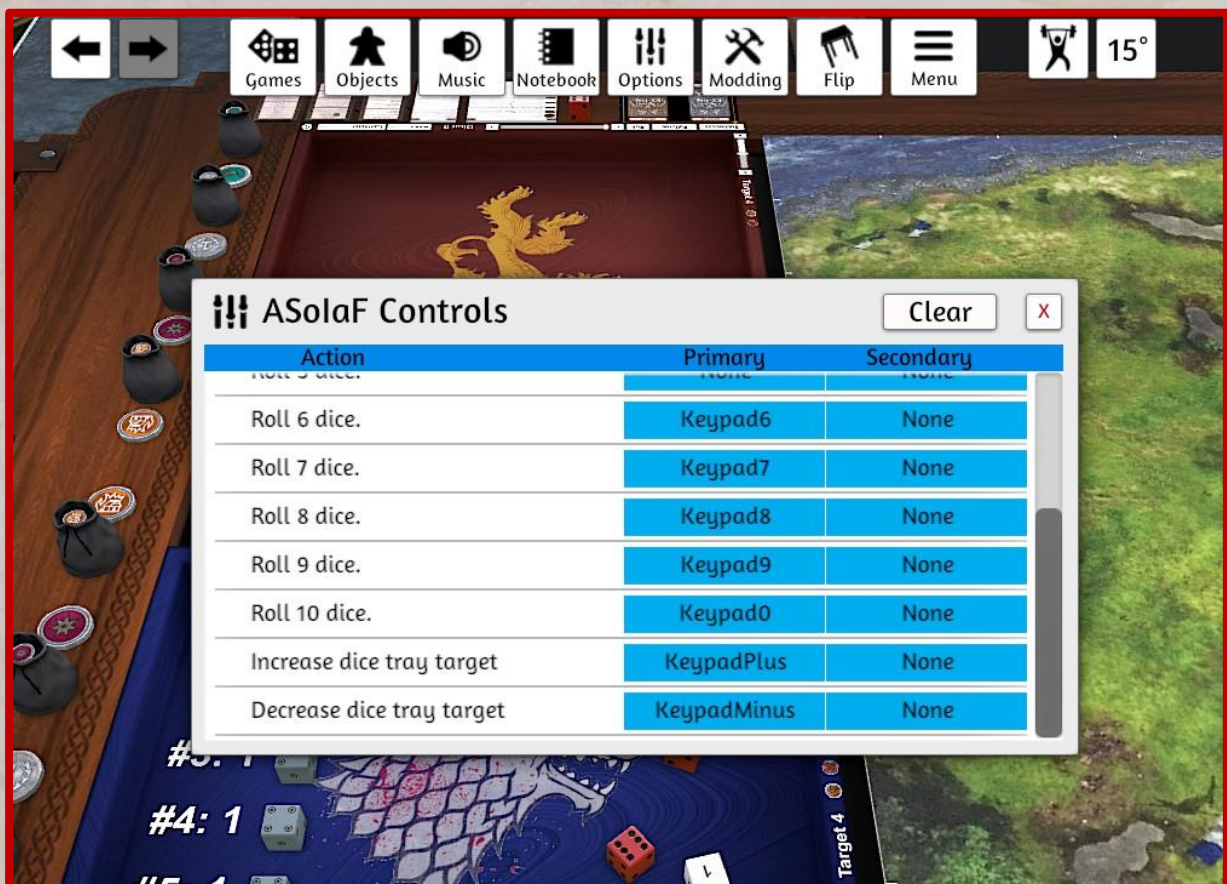

Key Bindings

The mod supports key bindings to control the dice tray however no keys are assigned by default. You will have to assign these yourself.

In order to do so click on Options in the top menu and then Game Keys from the drop down menu. This will bring up the key bindings dialog.

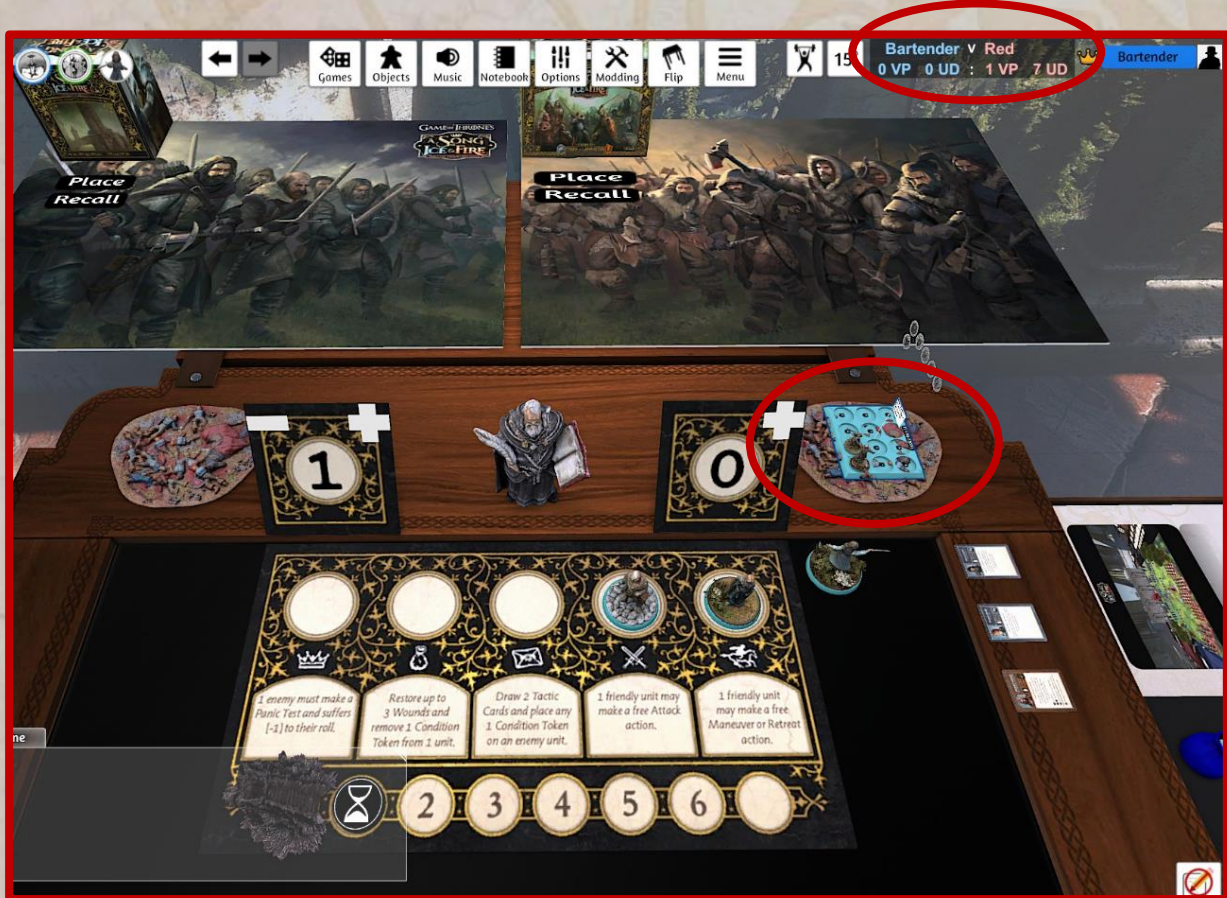

On this dialog you can assign keys in order to increase or decrease the target number as well as roll 1 through 10 dice.

Destroyed Units

When a unit is destroyed, unlock it by pressing [L] on you keyboard or removing all wounds from the unit. Then drag the unit onto the corpse pile next to the score board on your side of the table. This will automatically sum up your opponent's points for units destroyed (not VPs), provided the army was imported via the import gadget.

End of Round

Moving the Round token to the next spot on the tactics board will reset activations and orders on all units as well as storing their current location for the recall location feature.

It will then move the first player marker to the next player, announce that a new round has started and who the new first player is.

3D Model Showcase

The models were painted and scanned by dedicated community members. To give a shout out to them and appreciate their work, their names will be added as a description to each model and unit in the mod. To see a description, you have to hover over a model for a few seconds.
